When designing a solar system, it is essential to tailor it to align with the property's energy requirements. The solar system design process involves carefully studying how much energy is used, including peak times, seasonal changes, and expected growth. When we look at solar photovoltaic energy, we measure the data in two ways:

$r$  is the yield of the solar panel given by the ratio : electrical power (in kWp) of one solar panel divided by the area of one panel. Example : the solar panel yield of a PV module of 250 Wp with an area of 1.6 m<sup>2</sup> is 15.6%. Be aware that this nominal ratio is given for standard test conditions (STC) : radiation=1000 W/m<sup>2</sup>, cell temperature=25 celcius degree, Wind speed=1 m/s, AM=1.5.
