While natural sunlight provides vitamin D, which plays a role in immune function and bone health, it's not a primary cancer treatment. Some studies suggest a potential link between vitamin D and reduced cancer risk, but this isn't a substitute for established cancer treatments. Excessive sun exposure can increase skin cancer risk. Cancer treatment requires evidence-based medical approaches. Consult oncologists for comprehensive and safe cancer management, and discuss vitamin D levels for overall health.

Why do people use solar energy?

People have used the sun's rays (solar radiation) for thousands of years for warmth and to dry meat, fruit, and grains. Over time, people developed technologies to collect solar energy for heat and to convert it into electricity. Radiant energy from the sun has powered life on earth for many millions of years.

Why should you use solar power for your home?

Generating your own solar power can give you the freedom to keep the lights on if there's a disruption in power. Residential solar energy systems paired with battery storage--generally called solar-plus-storage systems--provide power regardless of the weather or the time of day without having to rely on backup power from the grid.

These benefits can help reduce the costs of installing solar panels and increase the overall return on investment. Energy independence

Land use may sound like an odd environmental benefit of solar energy, especially if you picture sprawling solar farms covering desert landscapes, but a 2022 study by the National Renewable Energy Lab (NREL) found that the land required for all of the solar, wind, and transmission infrastructure to decarbonize the US power sector by 2035 adds up ...

How does solar power work? Solar energy or solar power is energy that is derived from the sun's rays. Solar panels harness and convert the heat and light energy of the sun into usable electrical energy, which can then be transmitted to power homes and businesses. This is a green and sustainable source of energy because sunlight is always coming to the Earth.

These tools are great for getting started, but make sure to work with a solar installer for a custom estimate of how much power your solar energy system is likely to generate. For its analyses, NREL uses an average system size of 7.15 kilowatts direct-current with a 3-11 kilowatt range.

Solar radiation may be converted directly into electricity by solar cells (photovoltaic cells). In such cells, a small electric voltage is generated when light strikes the junction between a metal and a semiconductor (such as silicon) or the junction between two different semiconductors.(See photovoltaic effect.)The power generated by a single photovoltaic cell is ...
