3.1.1 Steam Rankine cycle solar plants. Steam Rankine cycles (SRCs), in several regenerative and reheating layouts, have been widely used in fossil or nuclear thermal plants. The steam at the turbine inlet is usually superheated in the first and saturated in the second ones. These cycles generally work with pressures below the critical pressure.

The ThermalBattery(TM) acts like an extraction by diverting live steam from the boiler away from the turbine when compelled and discharging back into the steam water cycle when opportune. The thermal storage responds within seconds to any change in load, or going from charge to discharge, enabling for the plant's participation in a myriad of ...
