1. Generation and Storage. New deployment of technologies such as long-duration energy storage, hydropower, nuclear energy, and geothermal will be critical for a diversified and resilient power system. In the near term, continued expansion of wind and solar can enhance resource adequacy, especially when paired with energy storage.

The energy storage technologies provide support by stabilizing the power production and energy demand. This is achieved by storing excessive or unused energy and supplying to the grid or customers whenever it is required. Further, in future electric grid, energy storage systems can be treated as the main electricity sources.
