1. Introduction. In order to mitigate the current global energy demand and environmental challenges associated with the use of fossil fuels, there is a need for better energy alternatives and robust energy storage systems that will accelerate decarbonization journey and reduce greenhouse gas emissions and inspire energy independence in the future.

Primary energy sources are found in nature and have not yet been transformed into more convenient forms of energy. Secondary energy sources are made using primary energy sources, for example electricity is a secondary energy, generated by a number of primary sources. These are more convenient to use in our daily lives.

The energy sector is undergoing a transformation driven by the need to decarbonize, modernize, and ensure energy security for future generations. Automation is addressing challenges such as the global push for clean energy, energy efficiency, energy storage, energy security, the skills gap, and aging infrastructure in the energy industry.
