Despite the advancements in photovoltaics, there is only minimal reductions in the cost of crystalline silicon solar cell technology. Hence it became crucial to explore low cost photovoltaic technologies for the continuous growth of industry. Discovery of thin layer semiconductor technology has opened up the path for thin film photovoltaics (TFPV).

Thin-film solar cells are cheaper than mature c-Si wafer cells (sheets). Moreover, thin films are easier to

handle and more flexible. They are also less vulnerable to destruction than their Si competitors. Although thin-film solar materials have slightly lower efficiency (i), they can outweigh the cost-benefit considering various applications.

**CIGS Thin-Film Photovoltaics** CIGS-based thin-film solar cell modules represent the highest-efficiency alternative for large-scale, commercial thin-film solar cells. In the schematic illustration, you see a typical CIGS layer stack on glass. In this design, the layers of the device are deposited onto a glass substrate.

Thin film solar cells are a promising approach for terrestrial and space photovoltaics and offer a wide variety of choices in terms of the device design and fabrication, but it would surely be determined by the simplicity of manufacturability and the cost per reliable watt. Thin film solar cells (TFSC) are a promising approach for terrestrial and space photovoltaics and offer a ...

This chapter provides an overview of thin film deposition techniques and applications in photovoltaics and highlights techniques that are currently in use or are promising for mass production ...

The chapter introduces the basic principles of photovoltaics, and highlights the specific material and device properties that are relevant for thin-film solar cells. In general, there are two configurations possible for any thin-film solar cell. The first possibility is that light enters the device through a transparent superstrate.
