What types of energy are used in the United States?

The United States uses many different energy sources and technologies to generate electricity. The sources and technologies have changed over time, and some are used more than others. The three major categories of energy for electricity generation are fossil fuels (coal, natural gas, and petroleum), nuclear energy, and renewable energy.

In 2011, small-scale solar accounted for 68% of total U.S. solar electricity net generation. However, utility-scale solar generation increased substantially in the United States during the past decade as average construction costs for solar power plants fell. In our long-term projections, the electric power sector continues to produce the most ...

Across the United States, over 11,000 utility-scale power plants generate electricity that is transmitted to customers via the nation's electric power grid. Learn how the power sector has changed over time, how power sector emissions affect human health and the environment, and how EPA's programs reduce emissions.

Electricity generation from renewable energy sources has been growing steadily in the United States over the past decade. Last year, electric power generation from all types of renewables accounted for nearly one-quarter of total generation by the U.S. electric power sector. Renewables" output tends to follow capacity additions

What is U.S. electricity generation by energy source? In 2023, about 4,178 billion kilowatthours (kWh) (or about 4.18 trillion kWh) of electricity were generated at utility-scale electricity generation facilities in the United States. 1 About 60% of this electricity generation was from fossil fuels--coal, natural gas, petroleum, and other gases. About 19% was from nuclear energy, ...

How and where electricity is generated. Electricity in the United States is generated using a variety of resources. The three most common are natural gas, coal, and nuclear power. Some of the fastest growing sources are renewable resources such as wind and solar. Most U.S. electricity is generated at centralized power plants.

Electricity generation. In 2023, net generation of electricity from utility-scale generators in the United States was about 4,178 billion kilowatthours (kWh) (or about 4.18 trillion kWh). EIA estimates that an additional 73.62 billion kWh (or about 0.07 trillion kWh) were generated with small-scale solar photovoltaic (PV) systems.
