

Vanadium vs lithium battery

What is a vanadium flow battery?

In fact, vanadium batteries are known for having the easiest end-of-life processing. Combine this with the fact that lithium batteries need to be replaced more often and lose capacity over time, a vanadium flow battery is a greener alternative to lithium that creates far less waste.

Are vanadium flow batteries safe?

Indeed, vanadium flow batteries offer the highest level of safety compared to any other battery technology on the market today. Vanadium flow batteries operate at a wider range of temperatures than lithium, so they can be installed both indoors and outdoors. In addition, vanadium flow batteries store energy in tanks, rather than cells.

What is the difference between a lithium and a vanadium battery?

Lithium batteries decay and lose capacity over time, while vanadium batteries discharge at 100% throughout their entire lifetime. To account for this capacity loss, lithium batteries often have to be oversized at the time of installation, adding to the costs involved, but with a vanadium battery, the capacity you purchase is the capacity you need.

Are vanadium flow batteries better than lithium-ion batteries?

Vanadium flow batteries are gaining attention in the media, various industries, and even the general public for the many benefits over lithium-ion batteries. Those benefits include longer life, very little degradation of performance over time, and a much wider operating temperature range. All of which significantly reduces the cost of ownership.

Why are vanadium batteries more expensive than lithium-ion batteries?

As a result, vanadium batteries currently have a higher upfront cost than lithium-ion batteries with the same capacity. Since they're big, heavy and expensive to buy, the use of vanadium batteries may be limited to industrial and grid applications.

Could vanadium flow batteries be the wave of the future?
