Kinetic Energy Storage Systems (KESS) are based on an electrical machine joined to a Flywheel. When the system stores energy, the electrical machine works as a motor and the flywheel is accelerated until it stores the nominal energy. When the system provides energy, the electrical machine works as a generator and the flywheel decelerates.

The speed of response of an energy storage system is a metric of how quickly it can respond to a demand signal in order to move from a standby state to full output or input power. The power output of a gravitational energy storage system is linked to the velocity of the weight, as shown in equation (5.8). Therefore, the speed of response is ...
