What is a pumped-storage system?

Pumped-storage schemes currently provide the most commercially important means of large-scale grid energy storage and improve the daily capacity factor of the generation system. The relatively low energy density of PHES systems requires either a very large body of water or a large variation in height.

What is pumped storage hydropower (PSH)?

Pumped storage hydropower (PSH) is a type of hydroelectric energy storage. It is a configuration of two water reservoirs at different elevations that can generate power as water moves down from one to the other (discharge), passing through a turbine. The system also requires power as it pumps water back into the upper reservoir (recharge).

How does pumped storage work?

Instead, a technology called pumped storage is rapidly expanding. These systems involve two reservoirs: one on top of a hill and another at the bottom. When electricity generated from nearby power plants exceeds demand, it's used to pump water uphill, essentially filling the upper reservoir as a battery.
