How can energy be stored?

Energy can also be stored by making fuels such as hydrogen, which can be burned when energy is most needed. Pumped hydroelectricity, the most common form of large-scale energy storage, uses excess energy to pump water uphill, then releases the water later to turn a turbine and make electricity.

How does energy storage work?

The so-called battery "charges" when power is used to pump water from a lower reservoir to a higher reservoir. The energy storage system "discharges" power when water, pulled by gravity, is released back to the lower-elevation reservoir and passes through a turbine along the way.
