To quantify the need for large-scale energy storage, an hour-by-hour model of wind and solar supply was compared with an hour-by-hour model of future electricity demand. The models were based on real weather data in the 37 years 1980 to 2016 and an assumed demand of 570 TWh/year. Thirty-seven years is not

Energy storage makes it possible to use power generated at a time other than when it is consumed. A power system with large-scale energy storage can use various types of generation in an optimal fashion. Large centralized generators can run at a steady rate, with no need to undergo inefficient cycling to respond to changes in demand.
