What is long-duration energy storage (LDEs)?

While the term long-duration energy storage (LDES) is often used for storage technologies with a power-to-energy ratio between 10 and 100 h,¹ we introduce the term ultra-long-duration energy storage (ULDES) for storage that can cover durations longer than 100 h (4 days) and thus act like a firm resource.

What drives the cost-effectiveness of long-duration storage technologies?

Moreover, the researchers conclude that energy storage capacity cost and discharge efficiency are the most critical drivers for the cost-effectiveness of long-duration storage technologies -- for example, energy capacity cost becomes the largest cost driver as discharge duration increases.

Why do we need longer duration energy storage?

However, if wind and solar penetration rises to cover all demand in the absence of other generation technologies, longer duration energy storage becomes necessary to supply multiple days or weeks of dark wind lulls and seasonal variations in supply and demand, as well as to bridge years of low renewable production.

Can long-duration energy storage technologies solve the intermittency problem?

Long-duration energy storage technologies can be a solution to the intermittency problem of wind and solar power but estimating technology costs remains a challenge. New research identifies cost targets for long-duration storage technologies to make them competitive against different firm low-carbon generation technologies.

How long do energy storage systems last?

The length of energy storage technologies is divided into two categories: LDES systems can discharge power for many hours to days or even longer, while short-duration storage systems usually remove for a few minutes to a few hours. It is impossible to exaggerate the significance of LDES in reaching net zero.

What is the ultra-long energy storage movement

LDES largely does what it says on the tin: refers to the storage of energy over a "long" period of time. "How long is long?" you may ask. The answer varies, given there is no set-in-stone definition. According to the Long Duration Energy Storage (LDES) Council, there are four main types of LDES.

For linear dielectrics, the energy density (U_e) equation is described as follows: (Equation 1) $U_e = 0.5 \epsilon_0 \epsilon_r E_b^2$ where ϵ_0 is the vacuum dielectric constant, ϵ_r is the relative dielectric constant and E_b is the breakdown strength. The dielectric constant (ϵ_r) and breakdown strength (E_b) are two key parameters to evaluate energy density. Polymer dielectrics with high ...
