Do all electric vehicles require more energy storage?

An all electric vehicle requires much more energy storage, which involves sacrificing specific power. In essence, high power requires thin battery electrodes for fast response, while high energy storage requires thick plates.

Do electric vehicles need a high-performance and low-cost energy storage technology?

In addition to policy support, widespread deployment of electric vehicles requires high-performance and low-cost energy storage technologies, including not only batteries but also alternative electrochemical devices.

Are electric vehicles a good option for the energy transition?

Our estimates are generally conservative and offer a lower bound of future opportunities. Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained.

Will electric vehicle batteries satisfy grid storage demand by 2030?

Renewable energy and electric vehicles will be required for the energy transition, but the global electric vehicle battery capacity available for grid storage is not constrained. Here the authors find that electric vehicle batteries alone could satisfy short-term grid storage demand by as early as 2030.

Are fuel cell electric vehicles more efficient than battery electric vehicles?

Some analysts have concluded that fuel cell electric vehicles are less efficient than battery electric vehicles since the fuel cell system efficiency over a driving cycle might be only 52%, whereas the round trip efficiency of a battery might be 80%. However, this neglects the effects of extra vehicle weight on fuel economy.
